

1 The language

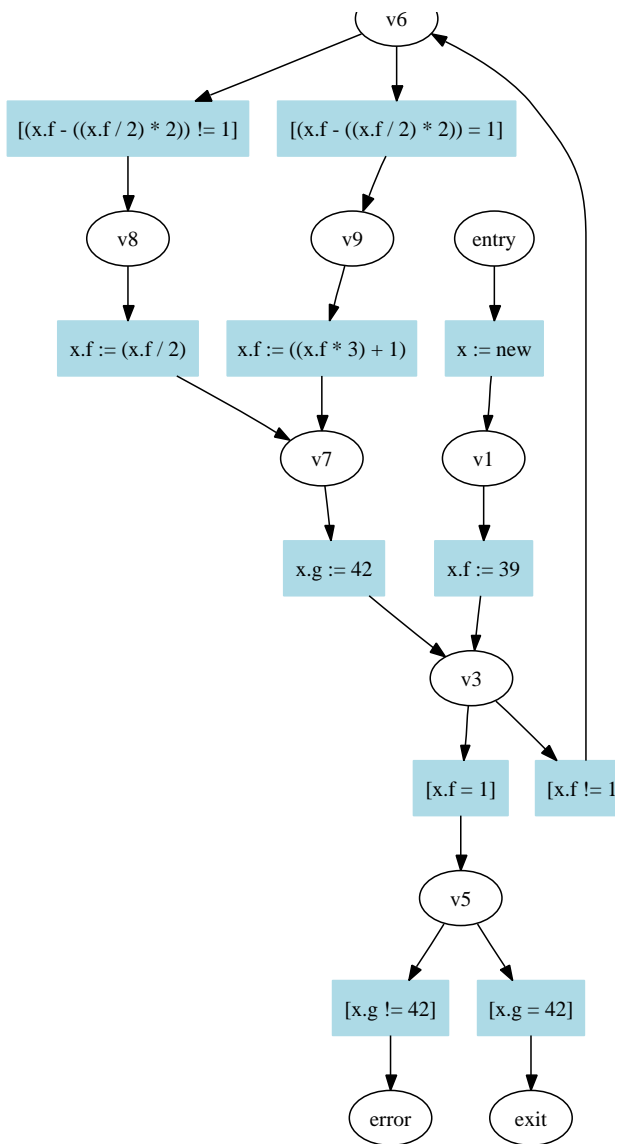

We work on a CFG, the following program statements can occur:

statement ::= $x.f := \text{expression} \mid x := y \mid x := \text{new}$
formula ::= $\text{expression} = \text{expression} \mid \text{expression} \neq \text{expression} \mid$
 $\text{expression} \leq \text{expression} \mid \text{expression} \geq \text{expression} \mid$
 $\text{expression} < \text{expression} \mid \text{expression} > \text{expression}$
expression ::= $\text{atomic} \mid \text{expression} + \text{expression} \mid \text{expression} - \text{expression} \mid$
 $\text{expression} * \text{expression} \mid \text{expression} / \text{expression}$
atomic ::= $x.f \mid \mathbf{c}$

x, y variables, f, g fields. \mathbf{c} constant

1.1 Assertions

Assertions are implemented as conditional jumps to an error state.

What about labels?
