

# Exercise: Balanced Parentheses

Show that the following balanced parentheses grammar is ambiguous (by finding two parse trees for some input sequence) and find unambiguous grammar for the same language.

$$B ::= \varepsilon \mid ( B ) \mid B B$$

# Remark

- The same parse tree can be derived using two different derivations, e.g.

$B \rightarrow (B) \rightarrow (BB) \rightarrow ((B)B) \rightarrow ((B)) \rightarrow (())$

$B \rightarrow (B) \rightarrow (BB) \rightarrow ((B)B) \rightarrow (())B \rightarrow (())$

this correspond to different orders in which nodes in the tree are expanded

- Ambiguity refers to the fact that there are actually multiple *parse trees*, not just multiple derivations.

# Towards Solution

- (Note that we must preserve precisely the set of strings that can be derived)
- This grammar:

$$B ::= \varepsilon \mid A$$
$$A ::= ( ) \mid A A \mid (A)$$

solves the problem with multiple  $\varepsilon$  symbols generating different trees, but it is still ambiguous: string  $( ) ( ) ( )$  has two different parse trees

# Solution

- Proposed solution:

$$B ::= \varepsilon \mid B (B)$$

- this is very smart! How to come up with it?
- Clearly, rule  $B ::= B B$  generates any sequence of B's. We can also encode it like this:

$$B ::= C^*$$

$$C ::= (B)$$

- Now we express sequence using recursive rule that does not create ambiguity:

$$B ::= \varepsilon \mid C B$$

$$C ::= (B)$$

- but now, look, we "inline"  $C$  back into the rules for so we get exactly the rule

$$B ::= \varepsilon \mid B (B)$$

This grammar is not ambiguous and is the solution. We did not prove this fact (we only tried to find ambiguous trees but did not find any).

## Exercise 2: Dangling Else

The dangling-else problem happens when the conditional statements are parsed using the following grammar.

$S ::= S ; S$

$S ::= \text{id} := E$

$S ::= \text{if } E \text{ then } S$

$S ::= \text{if } E \text{ then } S \text{ else } S$

Find an unambiguous grammar that accepts the same conditional statements and matches the else statement with the nearest unmatched if.

# Discussion of Dangling Else

```
if (x > 0) then
  if (y > 0) then
    z = x + y
else x = - x
```

- This is a real problem languages like C, Java
  - resolved by saying **else** binds to innermost **if**
- Can we design grammar that allows all programs as before, but only allows parse trees where else binds to innermost if?

# Sources of Ambiguity in this Example

- Ambiguity arises in this grammar here due to:
  - dangling **else**
  - binary rule for sequence (;) as for parentheses
  - priority between if-then-else and semicolon (;)

```
if (x > 0)
```

```
    if (y > 0)
```

```
        z = x + y;
```

```
        u = z + 1    // last assignment is not inside if
```

Wrong parse tree -> wrong generated code

# How we Solved It

We identified a wrong tree and tried to refine the grammar to prevent it, by making a copy of the rules. Also, we changed some rules to disallow sequences inside if-then-else and make sequence rule non-ambiguous. The end result is something like this:

```
S ::= ε | A S // a way to write S ::= A*
A ::= id := E
A ::= if E then A
A ::= if E then A' else A
A' ::= id := E
A' ::= if E then A' else A'
```

At some point we had a useless rule, so we deleted it.

We also looked at what a practical grammar would have to allow sequences inside if-then-else. It would add a case for blocks, like this:

```
A ::= { S }
A' ::= { S }
```

We could factor out some common definitions (e.g. define A in terms of A'), but that is not important for this problem.

# Exercise: Unary Minus

**1)** Show that the grammar

$$A ::= - A$$
$$A ::= A - id$$
$$A ::= id$$

is ambiguous by finding a string that has two different syntax trees.

**2)** Make two different unambiguous grammars for the same language:

**a)** One where prefix minus binds stronger than infix minus.

**b)** One where infix minus binds stronger than prefix minus.

**3)** Show the syntax trees using the new grammars for the string you used to prove the original grammar ambiguous.

# Exercise:

## Left Recursive and Right Recursive

We call a production rule “left recursive” if it is of the form

$$A ::= A p$$

for some sequence of symbols  $p$ . Similarly, a “right-recursive” rule is of a form

$$A ::= q A$$

Is every context free grammar that contains both left and right recursive rule for a some nonterminal  $A$  ambiguous?

Answer: yes, if  $A$  is reachable from the top symbol and productive can produce a sequence of tokens

# Making Grammars Unambiguous

- some recipes -

Ensure that there is always only one parse tree

Construct the correct abstract syntax tree

# Goal: Build Expression Trees

**abstract class** Expr

**case class** Variable(id : Identifier) **extends** Expr

**case class** Minus(e1 : Expr, e2 : Expr) **extends** Expr

**case class** Exp(e1 : Expr, e2 : Expr) **extends** Expr

different order gives different results:

Minus(e1, Minus(e2,e3))                      e1 - (e2 - e3)

Minus(Minus(e1,e2),e3)                      (e1 - e2) - e3

# Ambiguous Expression Grammar

```
expr ::= intLiteral | ident  
      | expr + expr | expr / expr
```

foo + 42 / bar + arg

Each node in parse tree is given by one grammar alternative.

Show that the input above has two parse trees!

# 1) Layer the grammar by priorities

$\text{expr} ::= \text{ident} \mid \text{expr} - \text{expr} \mid \text{expr} \wedge \text{expr} \mid (\text{expr})$

$\text{expr} ::= \text{term} (- \text{term})^*$   
 $\text{term} ::= \text{factor} (\wedge \text{factor})^*$   
 $\text{factor} ::= \text{id} \mid (\text{expr})$

lower priority binds weaker,  
so it goes outside

## 2) Building trees: left-associative "-"

### LEFT-associative operator

$x - y - z \rightarrow (x - y) - z$

$\text{Minus}(\text{Minus}(\text{Var}("x"), \text{Var}("y")), \text{Var}("z"))$

```
def expr : Expr = {  
  var e = term  
  while (lexer.token == MinusToken) {  
    lexer.next  
    e = Minus(e, term)  
  }  
  e  
}
```

### 3) Building trees: right-associative "^"

**RIGHT-associative** operator – using recursion  
(or also loop and then reverse a list)

$x \wedge y \wedge z \rightarrow x \wedge (y \wedge z)$   
`Exp(Var("x"), Exp(Var("y"), Var("z"))) )`

```
def expr : Expr = {  
  val e = factor  
  if (lexer.token == ExpToken) {  
    lexer.next  
    Exp(e, expr)  
  } else e  
}
```

# Manual Construction of Parsers

- Typically one applies previous transformations to get a nice grammar
- Then we write recursive descent parser as set of mutually recursive procedures that check if input is well formed
- Then enhance such procedures to construct trees, paying attention to the associativity and priority of operators

# Grammar Rules as Logic Programs

Consider grammar  $G$ :  $S ::= a \mid b S$

$L(\_)$  - language of non-terminal

$L(G) = L(S)$  where  $S$  is the start non-terminal

$L(S) = L(G) = \{ b^n a \mid n \geq 0 \}$

From meaning of grammars:

$$w \in L(S) \Leftrightarrow w=a \vee w \in L(b S)$$

To check left hand side, we need to check right hand side. Which of the two sides?

- restrict grammar, use current symbol to decide - LL(1)
- use dynamic programming (CYK) for any grammar

# Recursive Descent - LL(1)

- See wiki for
  - computing first, nullable, follow for non-terminals of the grammar
  - construction of parse table using this information
  - LL(1) as an interpreter for the parse table

# Grammar vs Recursive Descent Parser

```
expr ::= term termList
termList ::= + term termList
           | - term termList
           | ε
term ::= factor factorList
factorList ::= * factor factorList
            | / factor factorList
            | ε
factor ::= name | ( expr )
name ::= ident
```

```
def expr = { term; termList }
def termList =
  if (token==PLUS) {
    skip(PLUS); term; termList
  } else if (token==MINUS)
    skip(MINUS); term; termList
  }
def term = { factor; factorList }
...
def factor =
  if (token==IDENT) name
  else if (token==OPAR) {
    skip(OPAR); expr; skip(CPAR)
  } else error("expected ident or ")
```

# Rough General Idea

$A ::= B_1 \dots B_p$   
|  $C_1 \dots C_q$   
|  $D_1 \dots D_r$

```
def A =  
  if (token ∈ T1) {  
    B1 ... Bp  
  } else if (token ∈ T2) {  
    C1 ... Cq  
  } else if (token ∈ T3) {  
    D1 ... Dr  
  } else error("expected T1,T2,T3")
```

where:

$T1 = \mathbf{first}(B_1 \dots B_p)$

$T2 = \mathbf{first}(C_1 \dots C_q)$

$T3 = \mathbf{first}(D_1 \dots D_r)$

$\mathbf{first}(B_1 \dots B_p) = \{a \in \Sigma \mid B_1 \dots B_p \Rightarrow \dots \Rightarrow aw\}$

$T1, T2, T3$  should be **disjoint** sets of tokens.

# Computing **first** in the example

```
expr ::= term termList
termList ::= + term termList
           | - term termList
           | ε
term ::= factor factorList
factorList ::= * factor factorList
            | / factor factorList
            | ε
factor ::= name | ( expr )
name ::= ident
```

$\text{first}(\text{name}) = \{\mathbf{ident}\}$

$\text{first}(\text{( expr )}) = \{(\text{ )}\}$

$\text{first}(\text{factor}) = \text{first}(\text{name})$

$\cup \text{first}(\text{( expr )})$

$= \{\mathbf{ident}\} \cup \{(\text{ )}\}$

$= \{\mathbf{ident}, (\text{ )}\}$

$\text{first}(* \text{ factor factorList}) = \{*\}$

$\text{first}(/ \text{ factor factorList}) = \{/ \}$

$\text{first}(\text{factorList}) = \{*, / \}$

$\text{first}(\text{term}) = \text{first}(\text{factor}) = \{\mathbf{ident}, (\text{ )}\}$

$\text{first}(\text{termList}) = \{+, - \}$

$\text{first}(\text{expr}) = \text{first}(\text{term}) = \{\mathbf{ident}, (\text{ )}\}$

# Algorithm for **first**

Given an arbitrary context-free grammar with a set of rules of the form  $X ::= Y_1 \dots Y_n$  compute first for each right-hand side and for each symbol.

How to handle

- alternatives for one non-terminal
- sequences of symbols
- nullable non-terminals
- recursion

# Rules with Multiple Alternatives

$$A ::= B_1 \dots B_p \\ | C_1 \dots C_q \\ | D_1 \dots D_r$$

$$\text{first}(A) = \text{first}(B_1 \dots B_p) \\ \cup \text{first}(C_1 \dots C_q) \\ \cup \text{first}(D_1 \dots D_r)$$

## Sequences

$$\text{first}(B_1 \dots B_p) = \text{first}(B_1)$$

if not nullable( $B_1$ )

$$\text{first}(B_1 \dots B_p) = \text{first}(B_1) \cup \dots \cup \text{first}(B_k)$$

if nullable( $B_1$ ), ..., nullable( $B_{k-1}$ ) and  
not nullable( $B_k$ ) or  $k=p$

# Abstracting into Constraints

**recursive grammar:** constraints over finite sets:  $\text{expr}'$  is  $\text{first}(\text{expr})$

```
expr ::= term termList
termList ::= + term termList
           | - term termList
           | ε
term ::= factor factorList
factorList ::= * factor factorList
            | / factor factorList
            | ε
factor ::= name | ( expr )
name ::= ident
```

**nullable:** termList, factorList

```
expr' = term'
termList' = {+}
           ∪ {-}

term' = factor'
factorList' = {*}
            ∪ {/}

factor' = name' ∪ { ( }
name' = { ident }
```

For this nice grammar, there is no recursion in constraints. Solve by substitution.

# Example to Generate Constraints

$$\begin{aligned} S &::= X \mid Y \\ X &::= \mathbf{b} \mid S Y \\ Y &::= Z X \mathbf{b} \mid Y \mathbf{b} \\ Z &::= \varepsilon \mid \mathbf{a} \end{aligned}$$

$$\begin{aligned} S' &= X' \cup Y' \\ X' &= \end{aligned}$$

terminals:  $\mathbf{a}, \mathbf{b}$

non-terminals:  $S, X, Y, Z$

reachable (from  $S$ ):

productive:

nullable:

First sets of terminals:

$$S', X', Y', Z' \subseteq \{\mathbf{a}, \mathbf{b}\}$$

# Example to Generate Constraints

$$\begin{aligned} S &::= X \mid Y \\ X &::= \mathbf{b} \mid S Y \\ Y &::= Z X \mathbf{b} \mid Y \mathbf{b} \\ Z &::= \varepsilon \mid \mathbf{a} \end{aligned}$$

$$\begin{aligned} S' &= X' \cup Y' \\ X' &= \{\mathbf{b}\} \cup S' \\ Y' &= Z' \cup X' \cup Y' \\ Z' &= \{\mathbf{a}\} \end{aligned}$$

terminals:  $\mathbf{a}, \mathbf{b}$

non-terminals:  $S, X, Y, Z$

reachable (from  $S$ ):  $S, X, Y, Z$

productive:  $X, Z, S, Y$

nullable:  $Z$

These constraints are recursive.  
How to solve them?

$$S', X', Y', Z' \subseteq \{\mathbf{a}, \mathbf{b}\}$$

How many candidate solutions

- in this case?
- for  $k$  tokens,  $n$  nonterminals?

# Iterative Solution of **first** Constraints

	$S'$	$X'$	$Y'$	$Z'$
1.	$\{\}$	$\{\}$	$\{\}$	$\{\}$
2.	$\{\}$	$\{b\}$	$\{b\}$	$\{a\}$
3.	$\{b\}$	$\{b\}$	$\{a,b\}$	$\{a\}$
4.	$\{a,b\}$	$\{a,b\}$	$\{a,b\}$	$\{a\}$
5.	$\{a,b\}$	$\{a,b\}$	$\{a,b\}$	$\{a\}$

$$\begin{aligned} S' &= X' \cup Y' \\ X' &= \{b\} \cup S' \\ Y' &= Z' \cup X' \cup Y' \\ Z' &= \{a\} \end{aligned}$$

- Start from all sets empty.
- Evaluate right-hand side and assign it to left-hand side.
- Repeat until it stabilizes.

Sets grow in each step

- initially they are empty, so they can only grow
- if sets grow, the RHS grows (U is monotonic), and so does LHS
- they cannot grow forever: in the worst case contain all tokens

# Constraints for Computing Nullable

- Non-terminal is nullable if it can derive  $\varepsilon$

$$\begin{aligned} S &::= X \mid Y \\ X &::= \mathbf{b} \mid S Y \\ Y &::= Z X \mathbf{b} \mid Y \mathbf{b} \\ Z &::= \varepsilon \mid \mathbf{a} \end{aligned}$$

$$\begin{aligned} S' &= X' \mid Y' \\ X' &= 0 \mid (S' \ \& \ Y') \\ Y' &= (Z' \ \& \ X' \ \& \ 0) \mid (Y' \ \& \ 0) \\ Z' &= 1 \mid 0 \end{aligned}$$

$S', X', Y', Z' \in \{0,1\}$

0 - not nullable

1 - nullable

| - disjunction

& - conjunction

	$S'$	$X'$	$Y'$	$Z'$
1.	0	0	0	0
2.	0	0	0	1
3.	0	0	0	1

again monotonically growing

# Computing first and nullable

- Given any grammar we can compute
  - for each non-terminal  $X$  whether  $\text{nullable}(X)$
  - using this, the set  $\text{first}(X)$  for each non-terminal  $X$
- General approach:
  - generate constraints over finite domains, following the structure of each rule
  - solve the constraints iteratively
    - start from least elements
    - keep evaluating RHS and re-assigning the value to LHS
    - stop when there is no more change

# Rough General Idea

$A ::= B_1 \dots B_p$   
|  $C_1 \dots C_q$   
|  $D_1 \dots D_r$

```
def A =  
  if (token ∈ T1) {  
    B1 ... Bp  
  } else if (token ∈ T2) {  
    C1 ... Cq  
  } else if (token ∈ T3) {  
    D1 ... Dr  
  } else error("expected T1,T2,T3")
```

where:

$T1 = \text{first}(B_1 \dots B_p)$

$T2 = \text{first}(C_1 \dots C_q)$

$T3 = \text{first}(D_1 \dots D_r)$

$T1, T2, T3$  should be **disjoint** sets of tokens.

# Exercise 1

$A ::= B \text{ EOF}$

$B ::= \varepsilon \mid B B \mid (B)$

- Tokens: **EOF**, (, )
- Generate constraints and compute nullable and first for this grammar.
- Check whether first sets for different alternatives are disjoint.

## Exercise 2

$S ::= B \text{ EOF}$

$B ::= \varepsilon \mid B (B)$

- Tokens: **EOF**, (, )
- Generate constraints and compute nullable and first for this grammar.
- Check whether first sets for different alternatives are disjoint.

## Exercise 3

Compute nullable, first for this grammar:

$\text{stmtList} ::= \varepsilon \mid \text{stmt stmtList}$

$\text{stmt} ::= \text{assign} \mid \text{block}$

$\text{assign} ::= \text{ID} = \text{ID} ;$

$\text{block} ::= \text{beginof ID stmtList ID ends}$

Describe a parser for this grammar and explain how it behaves on this input:

**beginof** myPrettyCode

x = u;

y = v;

myPrettyCode **ends**

# Problem Identified

$\text{stmtList} ::= \varepsilon \mid \text{stmt stmtList}$

$\text{stmt} ::= \text{assign} \mid \text{block}$

$\text{assign} ::= \mathbf{ID} = \mathbf{ID} ;$

$\text{block} ::= \mathbf{beginof ID stmtList ID ends}$

## Problem parsing $\text{stmtList}$ :

- $\mathbf{ID}$  could start alternative  $\text{stmt stmtList}$
- $\mathbf{ID}$  could **follow**  $\text{stmt}$ , so we may wish to parse  $\varepsilon$  that is, do nothing and return
- For nullable non-terminals, we must also compute what follows them

# General Idea for nullable(A)

$A ::= B_1 \dots B_p$   
|  $C_1 \dots C_q$   
|  $D_1 \dots D_r$

```
def A =  
  if (token ∈ T1) {  
    B1 ... Bp  
  } else if (token ∈ (T2 ∪ TF)) {  
    C1 ... Cq  
  } else if (token ∈ T3) {  
    D1 ... Dr  
  } // no else error, just return
```

where:

$T_1 = \mathbf{first}(B_1 \dots B_p)$

$T_2 = \mathbf{first}(C_1 \dots C_q)$

$T_3 = \mathbf{first}(D_1 \dots D_r)$

$T_F = \mathbf{follow}(A)$

Only one of the alternatives can be nullable (e.g. second)  
 $T_1, T_2, T_3, T_F$  should be pairwise **disjoint** sets of tokens.

# LL(1) Grammar - good for building recursive descent parsers

- Grammar is LL(1) if for each nonterminal  $X$ 
  - first sets of different alternatives of  $X$  are disjoint
  - if nullable( $X$ ), first( $X$ ) must be disjoint from follow( $X$ )
- For each LL(1) grammar we can build recursive-descent parser
- Each LL(1) grammar is unambiguous
- If a grammar is not LL(1), we can sometimes transform it into equivalent LL(1) grammar

# Computing if a token can follow

**first**( $B_1 \dots B_p$ ) =  $\{a \in \Sigma \mid B_1 \dots B_p \Rightarrow \dots \Rightarrow aw\}$

**follow**( $X$ ) =  $\{a \in \Sigma \mid S \Rightarrow \dots \Rightarrow \dots Xa \dots\}$

There exists a derivation from the start symbol that produces a sequence of terminals and nonterminals of the form  $\dots Xa \dots$   
(the token  $a$  follows the non-terminal  $X$ )

# Rule for Computing Follow

Given  $X ::= YZ$  (for reachable  $X$ )

then  $\mathbf{first}(Z) \subseteq \mathbf{follow}(Y)$

and  $\mathbf{follow}(X) \subseteq \mathbf{follow}(Z)$

now take care of nullable ones as well:

For each rule  $X ::= Y_1 \dots Y_p \dots Y_q \dots Y_r$

$\mathbf{follow}(Y_p)$  should contain:

- $\mathbf{first}(Y_{p+1}Y_{p+2}\dots Y_r)$
- also  $\mathbf{follow}(X)$  if  $\mathbf{nullable}(Y_{p+1}Y_{p+2}Y_r)$

# Compute nullable, first, follow

stmtList ::=  $\epsilon$  | stmt stmtList

stmt ::= assign | block

assign ::= **ID = ID ;**

block ::= **beginof ID stmtList ID ends**

Is this grammar LL(1)?

# Conclusion of the Solution

The grammar is not LL(1) because we have

- nullable(stmtList)
- $\text{first}(\text{stmt}) \cap \text{follow}(\text{stmtList}) = \{\mathbf{ID}\}$
- If a recursive-descent parser sees **ID**, it does not know if it should
  - finish parsing stmtList or
  - parse another stmt

# Table for LL(1) Parser: Example

$S ::= B \text{ EOF}$   
(1)

$B ::= \varepsilon \mid B (B)$   
(1)      (2)

empty entry:  
when parsing  $S$ ,  
if we see  $)$ ,  
report error

nullable:  $B$

$\text{first}(S) = \{ ( \}$

$\text{follow}(S) = \{ \}$

$\text{first}(B) = \{ ( \}$

$\text{follow}(B) = \{ ), (, \text{EOF} \}$

**Parsing table:**

	EOF	(	)
S	{1}	{1}	{ }
B	{1}	{1,2}	{1}

**parse conflict - choice ambiguity:  
grammar not LL(1)**

1 is in entry because ( is in follow(B)

2 is in entry because ( is in first(B(B))

# Table for LL(1) Parsing

Tells which alternative to take, given current token:

choice : Nonterminal x Token  $\rightarrow$  Set[Int]

$$\begin{array}{l} A ::= (1) B_1 \dots B_p \\ \quad | (2) C_1 \dots C_q \\ \quad | (3) D_1 \dots D_r \end{array}$$

if  $t \in \text{first}(C_1 \dots C_q)$  add 2  
to choice(A,t)  
if  $t \in \text{follow}(A)$  add K to choice(A,t)  
where K is nullable alternative

For example, when parsing A and seeing token t

choice(A,t) = {2} means: parse alternative 2 ( $C_1 \dots C_q$ )

choice(A,t) = {1} means: parse alternative 3 ( $D_1 \dots D_r$ )

choice(A,t) = {} means: report syntax error

choice(A,t) = {2,3} : not LL(1) grammar

# Transform Grammar for LL(1)

$S ::= B \text{ EOF}$

$B ::= \varepsilon \mid B (B)$   
(1)      (2)

Transform the grammar so that parsing table has no conflicts.

$S ::= B \text{ EOF}$

$B ::= \varepsilon \mid (B) B$   
(1)      (2)

Left recursion is bad for LL(1)

Old parsing table:

	EOF	(	)
S	{1}	{1}	{}
B	{1}	{1,2}	{1}

**conflict - choice ambiguity:  
grammar not LL(1)**

- 1 is in entry because ( is in follow(B)
- 2 is in entry because ( is in first(B(B))

	EOF	(	)
S			
B			

choice(A,t)

# Parse Table is Code for Generic Parser

```
var stack : Stack[GrammarSymbol] // terminal or non-terminal
stack.push(EOF);
stack.push(StartNonterminal);
var lex = new Lexer(inputFile)
while (true) {
  X = stack.pop
  t = lex.curent
  if (isTerminal(X))
    if (t==X) if (X==EOF) return success
    else lex.next // eat token t
  else parseError("Expected " + X)
else { // non-terminal
  cs = choice(X)(t) // look up parsing table
  cs match { // result is a set
  case {i} => { // exactly one choice
    rhs = p(X,i) // choose correct right-hand side
    stack.push(reverse(rhs)) }
  case {} => parseError("Parser expected an element of " + unionOfAll(choice(X)))
  case _ => crash("parse table with conflicts - grammar was not LL(1)")
  }
}
```

# What if we cannot transform the grammar into LL(1)?

1) Redesign your language

2) Use a more powerful parsing technique
